•1 When the standby mode is set to ECO, network functions such as power on over the LAN network will not operate. Also, only certain commands can be received for external control using the serial terminal.

Measurement, measuring conditions, and method of notation all comply with ISO 21118 international standards.

The DVI-I IN terminal also accepts analog signals.

With legs at shortest position.

Operation range differs depending on environments.

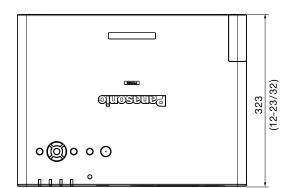

The operating temperature range is 0°C-35°C (32°F-95°F) when used in High-Altitude mode (1,400 m (4,593 ft) to 2,700 m (8,858 ft)).

*7 The operation system must be pre-installed at the factory or clean installed.

NOTE:

- The value for H (the height from the edge of the screen to the centre of the lens) is the value when the horizontal optical axis shift function is not used. The value decreases when the horizontal optical axis shift function is used. For details, see Shift range on page 7.
- The value for L (distance to screen) varies slightly depending on the zoom lens characteristics.
- $\bullet \ \, \text{At the shortest projection distance, the zoom lens characteristics may cause slight image distortion}.$
- When vertical keystone correction is used, the image is corrected in the direction that reduces its projected size.
- The brightness varies depending on the zoom setting.

PT-**FX400** LCD Projector

Calculation of the projection distance

For a screen size different from the above, use the equation below to calculate the projection distance.

Aspect ratio 4:3

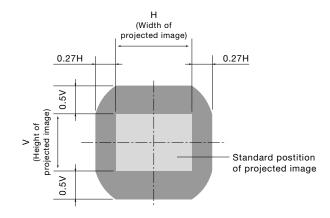

L (m) = (diagonal screen size in inches) \times 0.0305 - 0.049 minimum maximum L (m) = (diagonal screen size in inches) \times 0.0604 - 0.050

NOTE:

Distances calculated with the above equations will include a slight error.

Shift range

Optical axis shift function allows to shift the position of a projected image as shown below.

Installable angle

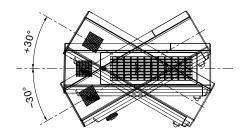

Install the projector at an angle within the range shown below.

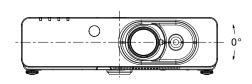

· Vertical direction

The projector may be installed at a vertical angle of 30°.

· Horizontal direction

The projector may not be angled horizontally.

List of compatible signals

The signals that can be input to this projector are shown in the table below. Horizontal scanning frequencies of 15.6 kHz to 91.1 kHz, vertical scanning frequencies of 24.0 Hz to 85.1 Hz, and a dot clock of 162 MHz maximum can be input.

NOTE: The native resolution of this projector is 1,024 × 768 pixels. If the display resolution of the input signal is different from the native resolution, image compression or expansion will be used to convert the input signal to a level within the native resolution.

PT-**FX400** LCD Projector

Serial connector

The serial connector complies with RS-232C. To control the projector from a personal computer, commands must be input through communication software, based on the format and satisfying the communication conditions shown below.

Pin assignments and signal names

Basic format

Transmission from the computer begins with STX, then the ID, command, parameter, and ETX are sent in this order. Add parameters according to the details of control.

CAUTION

- It may not be possible to send or receive commands for about 10 to 60 seconds when the lamp is first turned on. If this occurs, wait for 60 seconds, then try sending or receiving again.
- · When sending multiple commands, be sure to wait for at least 0.5 second after receiving a response from the projector before sending the next command.
- · Additional time is sometimes required for response due to processing inside the projector. Set the time-out period for command response to 10 seconds or more.
- · When using two or more units, set different IDs for each unit.

^{*1} Do not send PON, POF or OSH commands continuously in a short period of time. Doing so may burst the lamp or shorten the lamp replacement cycle

ment cycle.

*2 When a command that cannot be executed during standby mode is sent, the projector will send an ER401 command in reply.

To set the volume to +30, send the command as shown below.

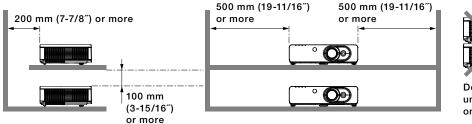

NOTE: When sending commands without parameters, a colon (:) is not necessary.

Notes on projector placement and operation

The projector uses a high-wattage lamp that becomes very hot during operation. Please observe the following precautions.

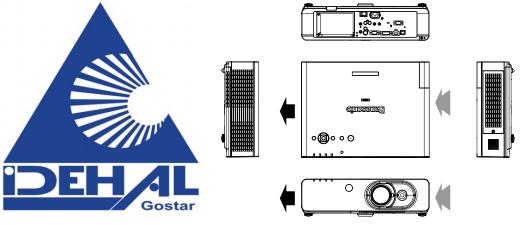

- 1. Never place objects on top of the projector while it is operating.
- 2. Make sure there is an unobstructed space of 500 mm (19-11/16) or more around the projector's exhaust openings. In addition to this space, also ensure that there is a sufficient work space for removing and installing the lamp, filter and other parts.
- 3. Do not stack projector units directly on top of one another for the purpose of multiple (stacked) projection. When stacking projector units, be sure to provide the amount of space indicated below between them. These space requirements also apply to installations where only one projector unit is operating at one time and the other unit is used as a backup.
- 3. If the projector is installed in an enclosed space, ensure that the projector's intake and exhaust openings are not blocked. Take particular care to ensure that hot air from the exhaust openings is not sucked into the intake openings.

Do not stack projector units directly on top of one another.

Direction of air intake and exhaust

Operating the projector continuously

- 1. If the projector is to be operated continuously 10 hours or more, lamp replacement cycle duration becomes shorter.
- 2. The lamp replacement cycle duration becomes shorter if the projector is operated repeatedly for short periods (one hour or less).
